

鍵盤Keypad

伍朝欽

<https://www.arduino.cc/reference/en/>

鍵盤

VCC:電源接5V

GND:GND

STB:strobePin

CLK:clockPin

DIO:dataPin

接digital pin

Arduino的寫入與讀取(write/read)

Arduino程式

```
byte data; (1) write  
bool state;  
pinMode(pin, OUTPUT);  
digitalWrite(pin, state);
```

外接硬體 (e.g., LED)

pin or register
Arduino的輸出裝置

(2) 傳輸

Output: 由程式輸出至硬體: **digitalWrite()**

Arduino程式

```
byte data; (2) read  
bool state;  
byte data  
state = digitalRead(pin);
```

外接硬體 (e.g., Keypad)

pin or register
Arduino的輸入裝置

(1) 傳輸

Input: 由硬體輸入至程式: **digitalRead()**

鍵盤對應腳位

- 以一個二維電路控制全部的按鍵
 - K1, K2, K3
 - KS1, KS2, KS3, ..., KS8
- 實際上最多可以有24個按鍵
- 對應的按鍵，按下為HIGH，放開為LOW
 - 以四個bytes紀錄每個按鍵的狀態

Bit	B7	B6	B5	B4	B3	B2	B1	B0
	X	K1	K2	K3	X	K1	K2	K3
byte0	X	KS2	KS2	KS2	X	KS1	KS1	KS1
byte1	X	KS4	KS4	KS4	X	KS3	KS3	KS3
byte2	X	KS6	KS6	KS6	X	KS5	KS5	KS5
byte3	X	KS8	KS8	KS8	X	KS7	KS7	KS7

- 這個板子只用到8個，K3這個column

Bit	B7	B6	B5	B4	B3	B2	B1	B0
	X	K1	K2	K3	X	K1	K2	K3
byte0	X	KS2	KS2	KS2	X	KS1	KS1	KS1
byte1	X	KS4	KS4	KS4	X	KS3	KS3	KS3
byte2	X	KS6	KS6	KS6	X	KS5	KS5	KS5
byte3	X	KS8	KS8	KS8	X	KS7	KS7	KS7

	B7	B6	B5	B4	B3	B2	B1	B0
	X	K1	K2	K3	X	K1	K2	K3
byte0	0			S5	0			S1
byte1	0			S6	0			S2
byte2	0			S7	0			S3
byte3	0			S8	0			S4

周邊輸出控制(以外接硬體技術文件的角度看)

- ▶ strobePin: LOW時開啟資料輸入/出閘口，HIGH時關閉
- ▶ clockPin: **HIGH→LOW**時輸出(寫到)到dataPin //注意: LOW → HIGH 是輸入，相反方向
- ▶ dataPin: 資料輸出

輸入示意圖:

數據命令與顯示控制指令

[illegible]

讀按鍵的時序

- cmd1:設定讀按鍵指令(sendByte(0x42))
- byte0~byte3:讀取按鍵數據

依序讀取八個按鍵的狀態，並儲存於一個byte中

OR

$i=2$

0	0	0	0	0	0	0	d2
---	---	---	---	---	---	---	----

$\ll 2$

0	0	0	0	0	d2	0	0
---	---	---	---	---	----	---	---

data

0	0	0	0	0	0	d1	d0
---	---	---	---	---	---	----	----

data

0	0	0	0	0	d2	d1	d0
---	---	---	---	---	----	----	----

OR

$i=3$

0	0	0	0	0	0	0	d3
---	---	---	---	---	---	---	----

$\ll 3$

0	0	0	0	d3	0	0	0
---	---	---	---	----	---	---	---

data

0	0	0	0	0	d2	d1	d0
---	---	---	---	---	----	----	----

data

0	0	0	0	d3	d2	d1	d0
---	---	---	---	----	----	----	----

產生八個clock週期，依序讀取八個bits，並將結果儲存到變數data(長度為一個byte)

```
byte data = 0x00;
for (int i = 0; i < 8; i++) {
    digitalWrite(clockPin, LOW);
    if (digitalRead(dataPin)) {
        data |= (0x01 << i);
    }
    digitalWrite(clockPin, HIGH);
}
```

// 將data初設值設為 0
// 只有當訊號是1時，
// 才需要將此結果儲存進對應的bit

模組化：讀取一個byte

```
byte get_byte(){
    byte data = 0x00;
    pinMode(dataPin, INPUT);          //將dataPin改為input

    for (int i = 0; i < 8; i++) {
        digitalWrite(clockPin, LOW);  //將clockPin從HIGH轉LOW，將data從dataPin輸出一個bit
        if (digitalRead(dataPin)) {   //若讀取到HIGH
            data |= (0x01 << i);      //將對應bit位置轉為1
        }
        digitalWrite(clockPin, HIGH); //將clockPin復位為HIGH
    }

    pinMode(dataPin, OUTPUT);          //將dataPin復位為output
    return data;
}
```

`digitalRead(pin);`
Pin: 要讀取的腳位
回傳值為HIGH或LOW

將回傳的四個bytes整合為一個byte

讀取按鍵流程：

Setup	i	Command	b7	b6	b5	b4	b3	b2	b1	b0
1		keys	0	0	0	0	0	0	0	0
2	0	temp(byte0)	0	0	0	S5	0	0	0	S1
3	0	temp<<i(i=0)	0	0	0	S5	0	0	0	S1
4	0	Keys = keys temp << i	0	0	0	S5	0	0	0	S1

步驟 1.先幫 keys 設一個初始值0x00 (00000000)

步驟 2.建立一個名稱為 temp 的byte變數 然後將byte0的資料(S1和S5)讀入

步驟 3.把 temp 內部的資料左移 i 格(當前i = 0,所以temp內部資料沒有移動)

步驟 4.把 temp 的資料合併到 keys裡面

以此類推完成後面3個byte的讀取

i		b7	b6	b5	b4	b3	b2	b1	b0
	keys	0	0	0	0	0	0	0	0
0	temp(byte0)	0	0	0	S5	0	0	0	S1
	temp<<i	0	0	0	S5	0	0	0	S1
	Keys = keys temp << i	0	0	0	S5	0	0	0	S1
1	temp(byte1)	0	0	0	S6	0	0	0	S2
	temp<<i	0	0	S6	0	0	0	S2	0
	Keys = keys temp << i	0	0	S6	S5	0	0	S2	S1
2	temp(byte2)	0	0	0	S7	0	0	0	S3
	temp<<i	0	S7	0	0	0	S3	0	0
	Keys = keys temp << i	0	S7	S6	S5	0	S3	S2	S1
3	temp(byte3)	0	0	0	S8	0	0	0	S4
	temp<<i	S8	0	0	0	S4	0	0	0
	Keys = keys temp << i	S8	S7	S6	S5	S4	S3	S2	S1

如何讀取按鍵的狀態

```
byte get_Button() //讀取按鍵回傳的函數
{
    byte keys = 0x00; //初設keys為0x00(表示沒有顯示資料)
    digitalWrite(strobePin,LOW);

    send(0x42); //開始執行從鍵盤讀入內容
```

```
    for(int i = 0 ; i < 4 ; i++) //開始分別讀取4個byte (byte0, byte1, byte2, byte3)
    {
        byte temp = get_byte();
        keys |= (temp << i); //將temp內部獲得的資料左移 i 格 然後合併到keys內部
    }
```

```
    digitalWrite(strobePin,HIGH);
    return keys;
}
```

keys[7:0] = S8 ~ S1;

另一種讀取鍵盤狀態的作法

- ▶ 既然是由dataPin一個接一個bit的讀進來，那就讀進來時，將需要的bit一一填入keys

`keys[7:0] = S8 ~ S1;`

	B7	B6	B5	B4	B3	B2	B1	B0
	X	K1	K2	K3	X	K1	K2	K3
byte0	0			S5	0			S1
byte1	0			S6	0			S2
byte2	0			S7	0			S3
byte3	0			S8	0			S4
